LE SERVICE MINITEL
DE L'INSTITUT DE MÉCANIQUE CÉLESTE
(Bureau des longitudes – Observatoire de Paris)
3615 ou 3616 code BDL

Le Service Minitel de l'*Institut de mécanique céleste* (Bureau des longitudes – Observatoire de Paris) met à la disposition des professionnels et des amateurs les informations suivantes :

- les actualités astronomiques ;
- les heures du lever et du coucher du Soleil et de la Lune, les azimuts et hauteurs du Soleil en n'importe quel lieu, de -4000 à 2500 ;
- les phases de la Lune et les dates des saisons de -4000 à 2500 ;
- les éclipses du Soleil et de la Lune pour six années courantes ;
- les positions apparentes géocentriques, les hauteurs et azimuts, les heures du lever et du coucher du Soleil, de la Lune et des planètes de 1900 à 2020 ;
- les coordonnées héliocentriques moyennes des planètes de 1900 à 2020 dans le repère de la date ;
- les positions des satellites naturels, les phénomènes des satellites galiléens pour quatre ans, et les phénomènes des satellites de Saturne pour les périodes où ils existent ;
- les définitions et les concordances des calendriers, les fêtes légales et religieuses, l'heure légale en France, les dates de changement d'heure et le calcul du jour de la semaine.

Il fournit également des informations régulières comme le ciel du mois et la visibilité des planètes et des informations ponctuelles comme les dates de passages de comètes, les dates des essaims météoriques...

ISSN 0769 – 1033

Dépôt légal : Décembre 2000

**LES SERVEURS SUR INTERNET
DE L'INSTITUT DE MÉCANIQUE CÉLESTE**

<http://www.bdl.fr> et <ftp://ftp.bdl.fr>

L'*Institut de mécanique céleste* diffuse de nombreuses informations, périodiquement remises à jour, grâce à ses serveurs sur le réseau *Internet*. Outre des informations générales sur l'histoire et les activités de l'*Institut de mécanique céleste*, on peut y trouver des données scientifiques concernant les objets du système solaire :

- éphémérides de planètes et de satellites, phénomènes ;
- données sur les objets du système solaire ;
- éléments orbitaux de comètes et d'astéroïdes ;
- données sur les éclipses du Soleil ;
- bases de données astrométriques.
- images astronomiques.

Un serveur WEB est accessible à l'adresse <http://www.bdl.fr>. Un serveur ftp anonyme est accessible à l'adresse: <ftp://ftp.bdl.fr>.

***THE INTERNET SERVERS
OF THE INSTITUTE OF CELESTIAL MECHANICS***

<http://www.bdl.fr> and <ftp://ftp.bdl.fr>

The Institute of celestial mechanics publishes information thanks to Internet servers. Besides general information concerning history and activities of the Institut de mécanique céleste, one may access scientific data on:

- *ephemerides of planets and satellites, phenomena;*
- *data on the objects of the Solar system;*
- *orbital elements of comets and asteroids;*
- *data on solar eclipses;*
- *astronomical data base.*
- *astronomical images.*

The address of the WEB Server is: <http://www.bdl.fr>. One can also access an anonymous-ftp server at the address: <ftp://ftp.bdl.fr>.

Avertissement

À partir de 1996, des éphémérides des satellites naturels ont été publiées dans la *Connaissance des Temps*. Une disquette pour micro-ordinateur accompagne cet ouvrage. Ces éphémérides donnent les positions des satellites de Mars, des satellites galiléens de Jupiter, des huit premiers satellites de Saturne et des cinq satellites d'Uranus sous forme de fonctions mixtes avec une précision proche de celle des théories originales.

Cependant, des observateurs ont souhaité continuer à disposer d'un ouvrage permettant d'identifier les satellites galiléens et de connaître les instants des phénomènes présentés par ces satellites et calculés à une seconde de temps près. En particulier, les configurations précises permettent très facilement de situer les satellites avec une précision de $10''$ par rapport à Jupiter.

On trouvera aussi des renseignements généraux sur les satellites galiléens en début d'ouvrage ainsi qu'une méthode de calcul des phénomènes pour l'année suivante en fin d'ouvrage.

Foreword

Starting from 1996, ephemerides of natural Satellites have been published in the Connaissance des Temps. A floppy disk is available. These ephemerides give the positions of the satellite of Mars, of the Galilean satellites of Jupiter, of the first eight satellites of Saturn and of the five satellites of Uranus under a mixed form of representation, involving secular and periodic terms and depending directly on time. The accuracy is near that of the original theories.

However, observers wish to keep ephemerides allowing to identify immediately the Galilean satellites and to know the dates of the phenomena which are calculated to the nearest second of time. This is given by the present booklet, particularly the configurations giving positions with an accuracy of $10''$ relatively to Jupiter.

Besides these informations, the present booklet gives various data concerning the Galilean Satellites. We also present a method which permits the calculation of the phenomena for the next year.

J.-E. Arlot

W. Thuillot

**THÉORIE DU MOUVEMENT
DES SATELLITES GALILÉENS**

**THEORY OF THE MOTION OF
THE GALILEAN SATELLITES**

Du fait de la complexité du mouvement des satellites galiléens, il est difficile de donner des valeurs précises pour les nœuds et les périjoves. En effet, les excentricités et les inclinaisons sont faibles (cf. tableau précédent) et tous ces éléments sont soumis à de grandes variations (Thuillot, Vu, 1985).

Because of the complexity of the motion of the Galilean Satellites of Jupiter it is difficult to provide precise values for nodes and perijoves. Indeed, eccentricities and inclinations are small (see the preceding table) and all these elements undergo large variations (Thuillot, Vu, 1985).

On donne ci-après les longitudes moyennes (d'après Sampson, 1921) dans le plan des orbites, ce plan étant confondu avec l'équateur de Jupiter.

The mean longitudes (Sampson, 1921) in the orbital planes identified with Jupiter's equator are given below.

Si τ est le temps en jours moyens compté à partir de 1900,0 on a :

If τ is the time in days which has elapsed from 1900.0, one gets:

| | | | | |
|---|----------------------------------|---|-----------------|--|
| $\gamma N_1 N_2 = 316^\circ.051 + 0.00003559 \tau, i = 3^\circ.10350$ | | | | |
| | $\gamma N_1 + N_1 N_2 + N_2 M =$ | | | Période sidérale en jours Sidereal period in days |
| Io | 42° .599 87 | + | 203.488 992 435 | τ 1.769 137 463 9 |

PRÉSENTATION DES ÉPHÉMÉRIDES
PRESENTATION OF THE EPHEMERIDES

ÉCHELLES DE TEMPS

L'argument "temps" des éphémérides publiées ici est le TT (temps terrestre) proche du TE (temps des éphémérides) et réalisé physiquement par la mesure du TAI (temps atomique international). On a :

$$TT = TAI + 32,184 \text{ s}$$

Les événements astronomiques étant mesurés dans l'échelle UTC (temps universel coordonné), le tableau ci-dessous donne la relation entre TT et UTC (d'après la relation entre TAI et UTC publiée par l'IERS).

| | TT - UTC |
|--|----------|
| du 1 juillet 1994 au 1 janvier 1996 | 61,184 s |
| du 1 janvier 1996 au 1 juillet 1997 | 62,184 s |
| du 1 juillet 1997 au 1 janvier 1999 | 63,184 s |
| à partir du 1 janvier 1999 | 64,184 s |

**PHÉNOMÈNES DES SATELLITES
GALILÉENS**

Les hypothèses utilisées pour le calcul des époques des phénomènes (Thuillot, 1989) sont les suivantes :

- Jupiter est un ellipsoïde dont l'aplatissement a pour valeur 1/15,4 et dont le rayon équatorial est 71 492 km.

- Les satellites sont des sphères de rayon : 1821 km pour Io, 1565 km pour Europe, 2634 km pour Ganymède, 2403 km pour Callisto (Davies et al., 1996).

- Le Soleil est une sphère de rayon 695 980 km.

- Les dates sont données pour tout observatoire terrestre puisqu'on peut négliger l'effet de parallaxe dont la grandeur est plus faible que la précision des prédictions.

TIME-SCALES

The time argument of the ephemerides is TT (terrestrial time) close to the former definition of ET (ephemeris time) and physically made by measuring TAI (international atomic time), so that:

$$TT = TAI + 32.184 \text{ s}$$

Astronomical events are measured in the time-scale UTC (coordinate universal time). The table below gives the correspondence between TTT and UTC (using the relationship between TAI and UTC published by IERS).

| | TT - UTC |
|---|-----------------|
| <i>From July 1, 1994 to January 1, 1996 ...</i> | <i>61,184 s</i> |
| <i>From January 1, 1996 to July 1, 1997</i> | <i>62,184 s</i> |
| <i>From July 1, 1997 to January 1, 1999 ...</i> | <i>63,184 s</i> |
| <i>From January 1, 1999</i> | <i>64,184 s</i> |

**PHENOMENA OF THE GALILEAN
SATELLITES**

The hypothesis made for the calculations of the dates of the phenomena (Thuillot, 1989) are:

- Jupiter is an ellipsoid the flatness of which is 1/15,4 and the equatorial radius of which is 71 492 km.

- The satellites are spheres the radius of which are: 1821 km for Io, 1565 km for Europe, 2634 km for Ganymede and 2403 km for Callisto (Davies et al., 1996).

- The Sun is a sphere the radius of which is 695 980 km.

- The dates are given for everywhere on Earth since no parallax effect has to be taken into account.

L'effet de phase est négligé pour les satellites, mais pris en compte pour la planète.

Les pages paires fournissent les dates des phénomènes que présentent ces satellites :

– les débuts et fins des passages des satellites devant la planète :

PA.D.INT et PA.D.EXT
PA.F.INT et PA.F.EXT

– les débuts et fins de leurs occultations (anciennement appelées immersions et émergences) :

OC.D.INT et OC.D.EXT
OC.F.INT et OC.F.EXT

– les débuts et fins des passages de leur ombre sur Jupiter :

OM.D.INT et OM.D.EXT
OM.F.INT et OM.F.EXT

– les débuts et fins des éclipses des satellites par Jupiter :

EC.D.INT, EC.D.EXT, EC.D.PEN
EC.F.INT, EC.F.EXT, EC.F.PEN

Les notations utilisées sont les suivantes :

– .D et .F désignent le début et la fin.

– .INT désigne les contacts intérieurs des satellites avec le cône d'ombre pour les éclipses et les passages des ombres sur Jupiter, et désigne les mêmes contacts avec le cône de visibilité pour les occultations et les passages devant la planète.

– .EXT désigne les contacts extérieurs des satellites avec le cône d'ombre pour les éclipses et les passages des ombres sur Jupiter, et désigne les mêmes contacts avec le cône de visibilité pour les occultations et les passages devant la planète.

– .PEN désigne uniquement pour les éclipses, le contact extérieur des satellites avec le cône de pénombre.

The phase defect is neglected on the satellites but taken into account for Jupiter.

Even pages give the dates of the phenomena:

– the beginnings and the ends of the transits of the satellites in front of Jupiter:

*PA.D.INT and PA.D.EXT
PA.F.INT and PA.F.EXT*

– the beginnings and the ends of the occultations of the satellites by Jupiter:

*OC.D.INT and OC.D.EXT
OC.F.INT and OC.F.EXT*

– the beginnings and the ends of the transits of the umbra of the satellites on the disk of Jupiter:

*OM.D.INT and OM.D.EXT
OM.F.INT and OM.F.EXT*

– the beginnings and the ends of the eclipses of the satellites by Jupiter:

*EC.D.INT, EC.D.EXT, EC.D.PEN
EC.F.INT, EC.F.EXT, EC.F.PEN*

The notations means:

– .D and .F mean beginning and end.

– .INT means:

*· interior contact satellite/shadow cone for the eclipses and transits of shadows on Jupiter,
· interior contact satellite/cone of visibility for the occultations and the transits.*

– .EXT means:

*· exterior contact satellite/shadow cone for the eclipses and transits of shadows on Jupiter,
· exterior contact satellite/cone of visibility for the occultations and the transits.*

– .PEN means exterior contact satellite/penumbra cone for the eclipses.

EXEMPLE

Le déroulement d'un début d'éclipse se fait ainsi :

- EC.D.PEN : contact extérieur du satellite avec le cône de pénombre (début de l'assombrissement).
- EC.D.EXT : contact extérieur avec le cône d'ombre.
- EC.D.INT : contact extérieur avec le cône d'ombre (assombrissement total).

On observera que les éclipses se produisent à l'ouest ou à l'est de la planète, suivant que l'on est avant ou après l'opposition. En général pour le premier et le deuxième satellite, on ne peut, avant l'opposition, observer que le début des éclipses suivi de la fin des occultations. Après l'opposition on ne peut observer que le début des occultations suivi de la fin des éclipses. Il est possible, d'autre part, que, en raison de l'inclinaison de l'équateur de Jupiter sur l'écliptique et de l'éloignement du satellite IV Callisto par rapport à la planète, aucun phénomène de ce satellite ne se produise.

EXAMPLE

A beginning of an eclipse occurs as follows:

- *EC.D.PEN: external contact of the satellite with the cone of penumbra (beginning of the penumbra).*
- *EC.D.EXT: external contact with the shadow cone.*
- *EC.D.INT: internal contact with the shadow cone (the satellite has disappeared in the umbra).*

Note that the eclipses occur west of the planet before the opposition. Most of time for the first and the second satellite, only the beginning of the eclipse followed by the end of the occultation are observable. On the other hand, it may happen that no phenomenon occurs for satellite IV because it is far from Jupiter and because of the inclination of the equator of Jupiter above the ecliptic.

LES CONFIGURATIONS

Les configurations permettent d'identifier les satellites, et également de déterminer leur position en coordonnées tangentielles équatoriales relatives à Jupiter avec la précision suivante (pour une lecture des courbes à 0,5 mm près) :

- Satellite 1: de 5'' à 20'' selon la vitesse apparente
- Satellite 2: de 5'' à 10'' selon la vitesse apparente
- Satellites 3 et 4: 5''

L'exemple suivant montre comment déterminer les positions des satellites. On reporte en abscisse sur l'axe ouest-est les distances $\Delta\alpha \cos \delta$ mesurées pour une date voulue, sur les courbes. L'ordonnée est donnée par les orbites apparentes. L'indétermination avant/arrière est levée grâce au sens de rotation des satellites.

THE CONFIGURATIONS

The configurations permit to identify the satellites and to approach their positions relative to Jupiter in an equatorial tangential frame with the following precision (corresponding to a measure on the curves with an accuracy of 0,5 millimeter):

- Satellite 1: from 5'' to 20'' depending on the apparent velocity
- Satellite 2: from 5'' to 10'' depending on the apparent velocity
- Satellites 3 and 4: 5''

The following example shows how to determine the positions of the satellites. For the abscissae, we have to project the differential coordinate $\Delta\alpha \cos \delta$ measured on the curves for a determined date on the East-West axis. For the ordinates, we have to project these abscissae on the apparent orbits as indicated on the figure. The front/back indetermination is removed thanks to the direction of the rotation of the satellites.

Dans le sens OUEST-EST, les satellites passent au-delà de Jupiter

CALCULS DES PHÉNOMÈNES POUR 2001

Les prédictions des phénomènes des satellites galiléens sont données suivant une représentation polynomiale en fonction d'une variable temporelle. La méthode (Thuillot, 1983) permet une représentation compacte puisque moins de 13 coefficients suffisent à représenter chaque type de phénomène (passages, occultations, éclipses, passages d'ombre, débuts ou fins) de chaque satellite pour une année entière avec une précision de l'ordre de la minute de temps.

Des explications sur cette méthode, le formulaire et les tables de coefficients sont données pages 69 à 73.

CALCULATIONS OF THE DATES OF THE PHENOMENA FOR 2001

The predictions of the phenomena of the Galilean Satellites are given as a polynomial representation which depends directly on time. The method (Thuillot, 1983) allows a compact representation as less than 13 coefficients are sufficient to represent each type of phenomenon (transits, occultations, eclipses, shadow transits, beginnings or ends) for each satellite for a complete year with an accuracy of about one minute of time.

Some explanations about the method, the formulae and the tables of coefficients are given on pages 69 to 73.

2001 - CONFIGURATIONS DES SATELLITES GALILÉENS DE JUPITER

Dans le sens OUEST-EST, les satellites passent au-delà de Jupiter

PHÉNOMÈNES POUR 2002

PHENOMENA FOR 2002

LES PHÉNOMÈNES POUR 2002

Pour l'année 2002, les phénomènes sont donnés par l'intermédiaire de coefficients d'un polynôme. On a ainsi une représentation sous une forme très condensée. La précision est cependant moins bonne que celle des prédictions des phénomènes pour 2001. Cette précision et la méthode pour déterminer les phénomènes sont données ci-après.

UTILISATION DES COEFFICIENTS

Soit P la période synodique moyenne d'un satellite; la date approchée T_1 du phénomène proche de la date T est donnée par la relation :

$$T_1 = KP + \tau/24 + T_0 \quad (1)$$

où K représente la partie entière de la quantité $(T - T_0)/P$ et où τ est donné, sur l'intervalle $(T_0, T_0 + DT)$ par un polynôme de la forme :

$$\tau = C_0 + C_1x + C_2x^2 + \dots + C_nx^n \quad (2)$$

avec

$$x = [2(T - T_0)/DT] - 1 \quad (3)$$

T_1 ayant été obtenu par la relation (1), on peut réitérer le calcul en substituant T_1 à T dans la formule (3) pour obtenir une date T_2 plus proche du phénomène recherché que T_1 . La précision de ce type de prédiction est meilleure que 60 secondes de temps.

Les tables donnent les coefficients C_i de la formule (2), numérotés à partir de C_0 pour les quatre satellites et pour les phénomènes:

- débuts et fins des éclipses des satellites par Jupiter (notés EC.D et EC.F),
- débuts et fins des occultations des satellites par Jupiter (notés OC.D et OC.F),
- débuts et fins des passages de l'ombre des satellites sur le disque de Jupiter (OM.D et OM.F),
- débuts et fins des passages des satellites devant la planète (PA.D et PA.F).

PHENOMENA FOR 2002

For 2002, the phenomena are given using polynomial coefficients. So, we have a compact representation. However, the accuracy is less than the one from the data given for 2001. This accuracy and the method of calculation of the phenomena are given here after.

USE OF THE COEFFICIENTS

Let P be the mean synodique period of a satellite; the approximate date T_1 of a phenomenon close to a date T is given by:

$$T_1 = KP + \tau/24 + T_0 \quad (1)$$

where K is the integer part of $(T - T_0)/P$ and where τ is given on the interval $(T_0, T_0 + DT)$ by a polynomial:

$$\tau = C_0 + C_1x + C_2x^2 + \dots + C_nx^n \quad (2)$$

with

$$x = [2(T - T_0)/DT] - 1 \quad (3)$$

The value T_1 deduced from equation (1) is then substituted in place of T in equation (3). The new iteration yields a date T_2 closer to the date of the phenomenon than T_1 . The precision of this type of prediction is better than 60 seconds of time.

The tables give the coefficients C_i in formula (2) numbered from C_0 for the four satellites and for the following phenomena:

- disappearance and reappearance of the satellites eclipsed by Jupiter (denoted respectively by EC.D and EC.F),
- disappearance and reappearance of the satellites occulted by Jupiter (denoted OC.D and OC.F),
- ingress and egress of the transits of the satellites shadow across the disc of Jupiter (OM.D and OM.F),
- ingress and egress of the satellites transits across the planet (PA.D and PA.F).

EXEMPLE D'UTILISATION

Déterminons les dates des phénomènes du satellite I (Io) au voisinage du 30 juin 2002.

Voyons tout d'abord le calcul pour le début d'éclipse pour lequel les tables donnent :

$$T_0 = 0; P = 1,7698605; DT = 366$$

Du 0 janvier au 30 juin 2002, 181 jours se sont écoulés, on a donc $T = 181$ et la formule (3) donne alors :

$$x = 2(181 - 0)/366 - 1 = -0,01092896$$

La formule (2) donne ensuite :

| |
|---|
| $\begin{aligned} \tau &= 37.123035 & - & 0.070246 & x & - & 0.431690 & x^2 \\ &+ & 0.026428 & x^3 & + & 0.183417 & x^4 \end{aligned}$ |
|---|

d'où : $\tau = 37,12375113$

On a d'autre part :

$$\begin{aligned} K &= \text{partie entière de } (181 - 0)/1,7698605 \\ &= 102 \end{aligned}$$

La formule (1) donne alors :

$$\begin{aligned} T_1 &= 102 \times 1,7698605 + 37,12375113/24 + 0 \\ T_1 &= 182,0725940 \text{ jours} \end{aligned}$$

depuis le 0 janvier (début de l'intervalle pour les éclipses) soit EC.D le 1^{er} juillet 2002 à 1h 44m 32s TT. Le calcul réitéré donne $T_2 = 182,0725785$ jours soit le 1^{er} juillet à 1h 44m 31s TT.

On trouverait de même pour les autres phénomènes :

| | | | | |
|------|----|------------|---|------------|
| PA.D | le | 30 juin | à | 4h 12m 31s |
| OM.D | le | 30 juin | à | 4h 32m 12s |
| PA.F | le | 30 juin | à | 6h 29m 39s |
| OM.F | le | 30 juin | à | 6h 49m 18s |
| OC.D | le | 1er juill. | à | 1h 25m 55s |
| OC.F | le | 1er juill. | à | 3h 42m 14s |
| EC.F | le | 1er juill. | à | 4h 1m 1s |

EXAMPLE

Let us find the dates of the phenomena of satellite I (Io) which take place near the 30th of June 2002.

Let us start with the computation of the disappearance for the eclipse of the satellite for which the tables gives :

$$T_0 = 0; P = 1,7698605; DT = 366$$

Between January 0 to June the 30th 2002, 181 days have elapsed: $T = 181$ and formula (3) gives :

$$x = 2(181 - 0)/366 - 1 = -0.01092896$$

Formula (2) then gives:

therefore $\tau = 37.12375113$

On the other hand :

$$\begin{aligned} K &= \text{integer part of } (181 - 0)/1.7698605 \\ &= 102 \end{aligned}$$

Formula (1) then gives :

$$\begin{aligned} T_1 &= 102 \times 1.7698605 + 37.12375113/24 + 0 \\ T_1 &= 182.0725940 \text{ days} \end{aligned}$$

from January 0 (beginning of the interval for the occultations) that is July the 1st 2002 at 1h 44m 32s TT. Another iteration gives $T_2 = 182.0725785$ days that is July the 1st 2002 at 1h 44m 31s TT.

One would find as well for the other phenomena:

| | | | |
|-------------|----------------------|-----------|-------------------|
| <i>PA.D</i> | <i>June the 30th</i> | <i>at</i> | <i>4h 12m 31s</i> |
| <i>OM.D</i> | <i>June the 30th</i> | <i>at</i> | <i>4h 32m 12s</i> |
| <i>PA.F</i> | <i>June the 30th</i> | <i>at</i> | <i>6h 29m 39s</i> |
| <i>OM.F</i> | <i>June the 30th</i> | <i>at</i> | <i>6h 49m 18s</i> |
| <i>OC.D</i> | <i>July the 1st</i> | <i>at</i> | <i>1h 25m 55s</i> |
| <i>OC.F</i> | <i>July the 1st</i> | <i>at</i> | <i>3h 42m 14s</i> |
| <i>EC.F</i> | <i>July the 1st</i> | <i>at</i> | <i>4h 1m 1s</i> |

CONDITIONS D'EXISTENCE DES PHÉNOMÈNES

Le recouvrement des cônes d'ombre et de visibilité rend inexistants certains phénomènes. Ainsi avant (ou après) l'opposition de Jupiter, les fins (respectivement débuts) d'éclipse et les débuts (respectivement fins) d'occultations sont inobservables. Ceci ne pouvant être pris en compte dans la représentation, il est nécessaire que l'utilisateur vérifie les conditions d'existence pour les éclipses et les occultations en calculant les quatre phases EC.D, EC.F, OC.D et OC.F. Ainsi, dans l'exemple précédent, on a dans l'ordre chronologique :

OC.D le 1^{er} juillet à 1h 25m 55s observable

EC.D le 1^{er} juillet à 1h 44m 31s inobservable car occulté

OC.F le 1^{er} juillet à 3h 42m 14s inobservable car déjà éclipsé

EC.F le 1^{er} juillet à 4h 1m 1s observable.

D'autre part, les caractéristiques de l'orbite du satellite IV (Callisto) font qu'il n'existe pas toujours de phénomènes. Les coefficients relatifs à ce satellite ne sont donc donnés que sur l'intervalle où ils existent.

CONDITIONS FOR THE EXISTENCE OF THE PHENOMENA

As the visibility and shadow cones may sometimes overlap, some of the computed phenomena may not exist. Thus, before (or after) the opposition of Jupiter, the reappearances (respectively the disappearances) for the eclipses, and the disappearances (respectively reappearances) for the occultations are not observable. This could not be taken into account in the representation; so the user will have to check the existence conditions of the eclipses and occultations by computing the four steps EC.D, EC.F, OC.D and OC.F. For instance, in the example above one has, in chronological order :

OC.D July 1st at 1h 25m 55s observable

EC.D July 1st at 1h 44m 31s unobservable as occulted

OC.F July 1st at 3h 42m 14s unobservable as eclipsed

EC.F July 1st at 4h 1m 1s observable.

Moreover, the orbit of satellite IV (Callisto) is such that phenomena are not always present. The coefficients for this satellite are given on the interval for which they exist.
