## AVERTISSEMENT

Depuis 1980, la *Connaissance des Temps* publie les éphémérides du Soleil, de la Lune, des planètes et des satellites Galiléens de Jupiter sous forme de coefficients de Tchébycheff. A partir de 1981, des éphémérides des huit premiers satellites de Saturne ont été publiées sous la même forme dans un supplément à la *Connaissance des Temps*. Ces éphémérides ayant été appréciées par les utilisateurs, nous avons décidé d'étendre ces publications à d'autres satellites naturels du Système Solaire.

Depuis 1985, nous publions dans un même recueil des éphémérides des satellites Galiléens de Jupiter, des huit premiers satellites de Saturne et des cinq satellites d'Uranus. Les éphémérides ne sont plus représentées à l'aide de coefficients de Tchébycheff, mais à l'aide de fonctions mixtes du paramètre « temps » comprenant des termes séculaires et des termes périodiques. Cette représentation permet de garder une bonne précision tout en diminuant notablement le nombre de valeurs numériques à publier et en autorisant une plus grande facilité d'emploi.

La liste des satellites dont nous publions les éphémérides n'est pas limitative et nous envisageons de l'étendre en fonction des données dont nous disposerons.

En dehors des éphémérides proprement dites cet ouvrage contient des données diverses sur les satellites de Jupiter, Saturne et Uranus et présente un formulaire permettant de calculer les phénomènes des satellites Galiléens de Jupiter

## FOREWORD

Since 1980, *Connaissance des Temps* has published ephemerides of the Sun, the Moon, the Planets and the Galilean Satellites of Jupiter as tables of Chebychev polynomials. From 1981, ephemerides of the First Eight Satellites of Saturn have been published under the same form in a supplement to the *Connaissance des Temps*. These ephemerides have been well received by the users ; hence, we now intend to enlarge the publication to incorporate other natural satellites of the planets.

Starting from 1985, we have gathered in this booklet, the ephemerides of the Galilean Satellites of Jupiter, the First Eight Satellites of Saturn and the Five Satellites of Uranus. The representation does not use Chebychev polynomials. It appears that a mixed form of representation, involving secular and periodic terms and depending directly on time, allows sufficient accuracy and reduces the amount of numerical data to be published. Furthermore, it is very easy to use these tables.

The list of the satellites, the ephemerides of which are published, is not limited and will be extended as soon as it is possible.

Beside the tables, the present publication contains various data concerning the satellites of Jupiter, Saturn and Uranus. We will also present, a formula which permits the calculation of the phenomena of the Galilean Satellites.

**PRÉSENTATION DES ÉPHÉMÉRIDES**  
***PRESENTATION OF THE EPHEMERIDES***

**CONTENU**

On trouve dans cette publication :

— des données sur les satellites Galiléens de Jupiter rassemblant les résultats d'un certain nombre de travaux théoriques ou d'observation effectués sur ces satellites, ainsi que des données (en général recommandées par l'UAI) sur l'ensemble des satellites de Jupiter, Saturne et Uranus, extraites de l'*Encyclopédie du Bureau des Longitudes* ;

— des tables permettant de calculer les positions des satellites Galiléens de Jupiter, des huit premiers satellites de Saturne et des cinq satellites d'Uranus ;

— des tables permettant de calculer les prédictions des phénomènes des satellites Galiléens de Jupiter.

Les éphémérides des satellites donnent les coordonnées différentielles tangentielles des satellites par rapport au centre de la planète :

$$X = \Delta\alpha \cos \delta \text{ et } Y = \Delta\delta$$

où  $\delta$  est la déclinaison de la planète et où  $\Delta\alpha$  et  $\Delta\delta$  sont les différences en ascension droite et en déclinaison entre le satellite et la planète.

Ces coordonnées sont des coordonnées moyennes rapportées à l'équateur de la date pour les satellites Galiléens de Jupiter et à l'équateur 1950.0 pour les satellites de Saturne et Uranus. L'axe des  $Y$  est dirigé vers le pôle de l'équateur moyen des coordonnées (nord) et l'axe des  $X$  est orienté dans le sens des ascensions droites croissantes (est).

Les théories utilisées pour la construction des éphémérides sont les suivantes :

— satellites Galiléens : la théorie de Sampson (1921) améliorée par Lieske (1977) ; les constantes introduites ont été déterminées par Arlot (1982) ;

— huit premiers satellites de Saturne : les théories issues des travaux de Rapaport (1977), de Kozai (1959) et de Struve (1930) ;

— satellites d'Uranus : la théorie issue du travail de Veillet (1983).

**REPRÉSENTATION  
DES COORDONNÉES**

Soit  $T$  une date Julienne appartenant à l'intervalle de temps  $T_0, T_0 + \Delta t$ , les coordonnées des satellites pour la date  $T$  sont données par la formule :

$$\left. \begin{matrix} X \\ Y \end{matrix} \right\} = A_0 + A_1 \cdot t + B_0 \sin(Nt + F_0) + B_1 \cdot t \sin(Nt + F_1) + B_2 \cdot t^2 \sin(Nt + F_2) + C_0 \sin(2Nt + P_0) \quad (1)$$

**CONTENTS**

*This publication contains the following :*

— *data on the Galilean satellites of Jupiter which sum the results of theoretical or observational studies in addition to various data (most of which are recommended by the IAU) concerning all known satellites of Jupiter, Saturn and Uranus. These data are found in the Encyclopédie du Bureau des Longitudes ;*

— *tables which allow the computation of the positions of the Galilean satellites of Jupiter, the first eight satellites of Saturn and the five satellites of Uranus ;*

— *tables to calculate the phenomena of the Galilean satellites of Jupiter.*

*These ephemerides of the satellites give the differential tangential coordinates of the satellites with respect to the centre of mass of the planet :*

$$X = \Delta\alpha \cos \delta \text{ and } Y = \Delta\delta$$

*where  $\delta$  is the declination of the planet,  $\Delta\alpha$  and  $\Delta\delta$  the separations in right ascension and declination between the satellite and the planet.*

*These coordinates are mean coordinates (equator of the date for the Galilean satellites and equator of 1950.0 for the satellites of Saturn and Uranus). The  $Y$ -axis is set towards the pole of the equator (North) and the  $X$ -axis towards the increasing right ascensions (East).*

*The theories which have been used for the construction of the ephemerides are :*

— *Galilean satellites : Sampson's theory (1921) improved by Lieske (1977) ; the constants introduced have been determined by Arlot (1982) ;*

— *first eight satellites of Saturn : theories from the studies of Rapaport (1977), Kozai (1959) and Struve (1930) ;*

— *satellites of Uranus : theory from Veillet's thesis (1983).*

**REPRESENTATION  
OF THE COORDINATES**

*Let  $T$  be a Julian date belonging to the interval of time  $T_0, T_0 + \Delta t$ . The coordinates of the satellites for the date  $T$  are given by the formula :*

où :

- $t = T - T_0$
- $A_0, A_1, B_0, F_0, B_1, F_1, B_2, F_2, C_0, P_0$  sont les coefficients numériques valables pour l'intervalle de temps  $T_0, T_0 + \Delta t$  contenant  $T$
- $N$  est la fréquence associée au satellite considéré. Cette fréquence est en général proche de celle du satellite lui-même, sauf dans le cas d'Hypérion pour lequel on prend une fréquence proche de celle de Titan du fait de l'existence d'un très gros terme perturbateur de fréquence plus grande que celle du satellite lui-même.

Cette représentation sous forme de fonctions mixtes (termes séculaires et sinusoïdaux) utilise le caractère quasi périodique des variations des positions des satellites naturels des planètes. On trouvera des explications détaillées sur cette représentation dans Chapront et Vu (1984).

## DESCRIPTION DES ÉPHÉMÉRIDES

Pour chaque satellite et pour chaque intervalle de temps, on donne :

- les dates de début et de fin de l'intervalle de validité ainsi que la date Julienne du début de l'intervalle ; cet intervalle peut varier de 2 jours pour Mimas à 32 jours pour les gros satellites d'Uranus ;
- deux jeux de coefficients  $A_0, A_1, B_0, F_0, B_1, F_1, B_2, F_2, C_0, P_0$  : l'un pour la coordonnée  $X$ , l'autre pour la coordonnée  $Y$ . Notons que pour quelques satellites (Titan, par exemple), certains coefficients ne sont pas donnés car ils sont nuls ;
- la valeur de la fréquence  $N$  associée au satellite est indiquée en haut de chaque page.

Les unités sont : la seconde de degré pour les coefficients  $A_0, B_0, C_0$ , la seconde de degré par jour pour  $A_1, B_1$ , la seconde de degré par (jour)<sup>2</sup> pour  $B_2$  ; les phases  $F_0, F_1, F_2, P_0$  sont mesurées en radian.  $N$  est en radian par jour et le paramètre « temps »  $t$  est compté en jours à partir du début de l'intervalle (époque  $T_0$ ).

## ÉCHELLES DE TEMPS

L'argument « temps » des éphémérides publiées ici est le TDB (temps dynamique barycentrique) que l'on peut confondre, à la précision des éphémérides, avec le TDT (temps dynamique terrestre), proche du TE (temps des éphémérides) et réalisé physiquement par la mesure du TAI (temps atomique international). On a :

$$\text{TDT} = \text{TAI} + 32,184 \text{ s}$$

where :

- $t = T - T_0$
- $A_0, A_1, B_0, F_0, B_1, F_1, B_2, F_2, C_0, P_0$  are numerical coefficients valid for the time interval  $T_0, T_0 + \Delta t$
- $N$  is the frequency associated with the chosen satellite. Generally,  $N$  is close to the natural frequency of the satellite itself. Nevertheless, in the case of Hyperion,  $N$  is close to the frequency of Titan because of the appearance of a large disturbing term which frequency is larger than the proper frequency of the satellite.

This representation with mixed functions (secular and sinusoidal terms) of time, makes use of the quasi-periodic character of the variations of the differential coordinates of the satellites. Detailed explanations about this representation are given in Chapront and Vu (1984).

## DESCRIPTION OF THE EPHEMERIDES

The following is given for each satellite and for each time interval :

- the dates of the beginning and end of the interval and the Julian date of the beginning. The duration of the time interval may cover from 2 days (in the case of Mimas) to 32 days (in the case of the larger satellites of Uranus) ;
- two sets of coefficients  $A_0, A_1, B_0, F_0, B_1, F_1, B_2, F_2, C_0, P_0$  : the first set for the  $X$ -coordinate and the second set for the  $Y$ -coordinate. Let us note that for some satellites (Titan for example) some coefficients, with zero value, are not listed ;
- the value of frequency  $N$ , associated with the satellite indicated at the top of each page.

Units of the data :  $A_0, B_0, C_0$  in arcsecond ;  $A_1$  and  $B_1$  in arcsecond per day and  $B_2$  in arcsecond per (day)<sup>2</sup>. For phases  $F_0, F_1, F_2, P_0$  the unit is the radian.  $N$  is expressed in radian per day and  $t$  in days from the beginning of the interval (epoch  $T_0$ ).

## TIME-SCALES

The time argument of the ephemerides is TDB (barycentric dynamical time) which can be identified with TDT (terrestrial dynamic time) close to the former definition of ET (ephemeris time) and physically made by measuring TAI (international atomic time), so that :

$$\text{TDT} = \text{TAI} + 32.184 \text{ s}$$

Les événements astronomiques étant mesurés dans l'échelle UTC (temps universel coordonné), le tableau ci-dessous donne la relation (entre le 1<sup>er</sup> janvier 1979 et le 31 décembre 1984) entre TDT et UTC (d'après la relation entre TAI et UTC publiée par le BIH).

*Astronomical events are measured in the time-scale UTC (coordinate universal time). The table below gives the correspondence (from 1979 January 1 to 1984 December 31) between TDT and UTC (using the relationship between TAI and UTC published by BIH).*

		TDT-UTC
1979 Jan. 1 - 1980 Jan. 1	1	50.184 s
1980 Jan. 1 - 1981 Juil. 1	1	51.184 s
1981 Juil. 1 - 1982 Juil. 1	1	52.184 s
1982 Juil. 1 - 1983 Juil. 1	1	53.184 s
1983 Juil. 1 - 1984 Déc. 31	1	54.184 s

Pour 1986, on ne sait pas encore quelle en sera la valeur ; on peut cependant prendre 55 secondes, l'erreur commise n'ayant que peu d'influence sur la valeur des positions calculées des satellites.

*For 1986, the value of TDT-UTC is not yet known ; one may take 55 seconds ; the error made will have little effect on the values of the calculated positions of the satellites.*

### EXEMPLE DE CALCUL D'UNE POSITION

Pour calculer les coordonnées  $X$  et  $Y$  d'un satellite pour une date  $T$  exprimée en UTC :

- on effectue une correction déduite du tableau du paragraphe précédent pour se ramener à l'échelle TDT (identifiée à TDB) ;
- on cherche parmi les tableaux représentant  $X$  et  $Y$  celui qui correspond à l'intervalle  $T_0, T_0 + \Delta t$  dans lequel se trouve  $T$  ;
- on applique la formule (1) avec  $t = T - T_0$ .

Il faut insister sur le fait que la représentation n'est valable que sur son intervalle de validité :  $T$  doit être compris entre  $T_0$  et  $T_0 + \Delta t$ .

**EXEMPLE :** Calculer les coordonnées tangentielles de Téthys (3<sup>e</sup> satellite de Saturne) par rapport à la planète, le 5 janvier 1986 à 23 h 30 min UTC.

On effectue d'abord une correction pour se ramener à l'échelle TDB. Pour 1986 nous avons choisi 55 secondes ; la date  $T$  est donc le 5 janvier 1986 à 23 h 30 min 55 s TDB.

Les coefficients nécessaires au calcul de  $X$  et  $Y$  sont ceux de la page 67 correspondant à l'intervalle du 1<sup>er</sup> janvier à 0 h au 17 janvier à 0 h. On a, pour  $X$  :

$$A_0 = 0., \quad A_1 = 0., \quad B_0 = 37.7362, \quad B_1 = 0.06321, \quad B_2 = 0.000489, \quad C_0 = 0.0032 \\ F_0 = 2.928197, \quad F_1 = 1.9175, \quad F_2 = 3.6436, \quad P_0 = 2.6640$$

et pour  $Y$  :

$$A_0 = -0.0012, \quad A_1 = 0., \quad B_0 = 15.6140, \quad B_1 = 0.02993, \quad B_2 = 0.000148, \quad C_0 = 0.0013 \\ F_0 = 4.591307, \quad F_1 = 3.8733, \quad F_2 = 5.4243, \quad P_0 = 4.3350$$

On applique ensuite la formule (1) :

$$\left. \begin{matrix} X \\ Y \end{matrix} \right\} = A_0 + A_1 \cdot t + B_0 \sin(Nt + F_0) + B_1 \cdot t \sin(Nt + F_1) + B_2 \cdot t^2 \sin(Nt + F_2) + C_0 \sin(2Nt + P_0)$$

### EXAMPLE OF A POSITION CALCULATION

To compute the  $X$  and  $Y$  coordinates of a satellite for a date  $T$  (expressed in UTC), one has to :

- apply the correction deduced from the preceding table to express the date  $T$  in TDT (identified with TDB) ;
- select from the tables of coefficients, the one which corresponds to the time interval  $T_0, T_0 + \Delta t$  where  $T$  is found ;
- apply formula (1) with  $t = T - T_0$ .

It is important to state that the representation is valid only for its time interval :  $T$  must belong to the interval  $T_0, T_0 + \Delta t$ .

**EXAMPLE :** Let us compute the tangential coordinates of Tethys (third satellite of Saturn) with respect to the planet for 1986 January 5, 23 h 30 min UTC.

First, the date must be corrected in order to fit with the TDB time-scale. For 1986, we choose 55 seconds ; so, the date  $T$  is 1986 January 5, 23 h 30 min 55 s TDB.

The coefficients necessary to compute  $X$  and  $Y$  are given on page 67 (interval from January 1, 0 h to January 17, 0 h). We read for  $X$  :

and for  $Y$  :

On a ici :

$N = 3,328$  radian/jour  
 $t$  est le nombre de jours écoulés entre le 1<sup>er</sup> janvier à 0 h (début de l'intervalle) et le 5 janvier à 23 h 30 min 55 s, soit 4,979 803 jours.

On obtient finalement :

$$\begin{aligned} X &= + 22,78'' \\ Y &= + 11,64'' \end{aligned}$$

Where :

$N = 3.328$  radian/day  
 $t$  is the number of days elapsed between January 1, 0 h (beginning of the interval) and January 5, 23 h 30 min 55 s. Hence  $t = 4.979 803$  days.

Finally, we get :

$$\begin{aligned} X &= + 22.78'' \\ Y &= + 11.64'' \end{aligned}$$

## PRÉCISION DES ÉPHÉMÉRIDES

Les théories dont sont issues les éphémérides sont construites pour la plupart avec une précision meilleure que 0,01" géocentrique.

Les observations utilisées pour l'ajustement des constantes et aussi certains défauts de la théorie ne permettent d'obtenir en réalité qu'une précision de 0,05" ; cette précision peut n'être que de 1" pour certains satellites de Saturne.

La représentation en fonctions mixtes publiée ici a été déterminée de façon à ce que l'écart avec la théorie-source soit toujours inférieur à 0,01".

## ACCURACY OF THE EPHEMERIDES

The theories from which are built the ephemerides have an internal precision better than 0.01" (in a geocentric reference frame).

In reality, the observations used to fit the constants and shortcomings in the theories, allow a precision of only 0.05" which may reach 1" for some satellites of Saturn.

The representation in mixed functions, as published here, has been determined in such a way that the difference between the representation and the source always remains below 0.01".

## PHÉNOMÈNES DES SATELLITES GALILÉENS DE JUPITER

Les prédictions des phénomènes des satellites Galiléens sont données suivant une représentation polynômiale en fonction d'une variable temporelle. La méthode (Thuillot, 1983) permet une représentation compacte puisque 14 coefficients suffisent à représenter chaque type de phénomène (passages, occultations, éclipses, passages d'ombre, débuts ou fins) de chaque satellite pour une année entière avec une précision de l'ordre de la minute de temps.

Des explications sur cette méthode, le formulaire et les tables de coefficients sont donnés pages 42 à 45.

## PHENOMENA OF THE GALILEAN SATELLITES OF JUPITER

The predictions of the phenomena of the Galilean Satellites are given as a polynomial representation which depends directly on time. The method (Thuillot, 1983) allows a compact representation as only 14 coefficients are sufficient to represent each type of phenomenon (transits, occultations, eclipses, shadow transits, beginnings or ends) for each satellite for a complete year with an accuracy of about one minute of time.

Some explanations about the method, the formulae and the tables of coefficients are given on pages 42 to 45.

<i>I</i> : 820 nm	1.15	0.95	0.57	0.31
<i>Albédo de Bond</i> (visuel)				
	0.54	0.49	0.29	0.15
<i>Demi-grand axe</i> (Sampson, 1921)				
en UA :	0.002820	0.004486	0.007155	0.012586
en rayons de Jupiter :	5.87	9.34	14.91	26.22
en kilomètres :	421810	671140	1070500	1882900
<i>Plus grande élongation</i> à l'opposition de Jupiter (minutes et secondes de degré)				
Sampson (1921) :	2' 17"	3' 40"	5' 48"	10' 13"
<i>Période synodique</i> (jours)				
Sampson (1921) :	1.7698604883	3.5540941742	7.1663872292	16.7535523007
<i>Inclinaison moyenne</i> sur l'équateur de Jupiter pour 1986.5 (minutes et secondes de degré)				
Sampson (1921) :	1' 20"	26' 30"	11' 15"	19' 57"
<i>Valeur moyenne de l'excentricité</i> pour 1986.5				
Sampson (1921) :	0.004	0.010	0.001	0.008
<i>Partie séculaire du mouvement</i> (degrés par an)				
nœud :	- 48.5	- 11.9	- 2.6	- 0.6
périjove :	57.0	14.6	2.7	0.7
Sampson (1921)				

**Théorie du mouvement  
des satellites Galiléens**

**Theory of the motion of  
the Galilean satellites**

(repère moyen de la date)  
(mean frame of the date)

Du fait de la complexité du mouvement des satellites Galiléens, il est difficile de donner des valeurs précises sur les nœuds et les périjoves. En effet, les excentricités et les inclinaisons sont faibles (cf. tableau précédent) et tous ces éléments sont soumis à de grandes variations.

On donne ci-après les longitudes moyennes (d'après Sampson, 1921) dans le plan des orbites, ce plan étant confondu avec l'équateur de Jupiter.

Si  $\tau$  est le temps en jours moyens compté à partir de 1900,0 on a :

*Because of the complexity of the motion of the Galilean satellites of Jupiter it is difficult to provide precise values for nodes and perijoves. Indeed, eccentricities and inclinations are small (see the preceding table) and all these elements undergo large variations.*

*The mean longitudes (Sampson, 1921) in the orbital planes identified with Jupiter's equator are given below.*

*If  $\tau$  is the time in days which has elapsed from 1900.0, one gets :*

$$\gamma N_1 N_2 = 316.051^\circ + 0.00003559 \tau, \quad i = 3.10350^\circ$$

	$\gamma N_1 + N_1 N_2 + N_2 M$	Période sidérale en jours Sidereal period in days
Io	$142.59987^\circ + 203.488992435 \tau$	1.7691374639
Europe	$99.55081^\circ + 101.374761672 \tau$	3.5511797420
Ganymède	$168.02628^\circ + 50.317646290 \tau$	7.1545476894
Callisto	$234.40790^\circ + 21.571109630 \tau$	16.6889884746

#### NOTES

(S) : révolution synchrone

(R) : révolution rétrograde

(1) : les éphémérides des satellites VI, VII, VIII et IX sont données sous forme de coefficients de Tchébycheff dans le supplément à la Connaissance des Temps « Satellites faibles... »

(2) : inclinaison sur l'orbite de Jupiter

(S) : synchronous revolution

(R) : retrograde revolution

(1) : the ephemerides for satellites VI, VII, VIII and IX are given as Chebychev coefficients in the *Supplément à la Connaissance des Temps « Faint Satellites... »*

(2) : inclination on Jupiter's orbit

Données extraites de l'*Encyclopédie du Bureau des Longitudes*.

Data from the *Encyclopédie du Bureau des Longitudes*.

## ÉPHÉMÉRIDES DES SATELLITES GALILÉENS

### EPHEMERIDES OF THE GALILEAN SATELLITES

Coordonnées différentielles tangentiels données en secondes de degré dans le repère équatorial moyen de la date. *Differential tangential coordinates given in arcsecond in the mean equatorial frame of the date.*

$$\begin{aligned} \Delta\alpha \cos\delta &= X \\ \Delta\delta &= Y \end{aligned}$$

$$\left. \begin{array}{l} X \\ Y \end{array} \right\} = A0 + A1 \cdot t + B0 \sin(Nt + F0) + B1 \cdot t \sin(Nt + F1) + B2 \cdot t^2 \sin(Nt + F2) + C0 \sin(2Nt + P0)$$

où  $t = T - T0$  avec  $T0$  date du début de l'intervalle et  $T$  date du calcul *where  $t = T - T0$  with  $T0$  date of beginning of the interval and  $T$  the date for the calculation*

## PHÉNOMÈNES DES SATELLITES GALILÉENS

### DESCRIPTION :

Les satellites Galiléens, dont les orbites sont faiblement inclinées sur l'équateur et sur l'écliptique, présentent de nombreux phénomènes. Au cours de chaque révolution, les trois premiers satellites, et en général le quatrième satellite, traversent le cône de visibilité et le cône d'ombre qui s'appuient sur la planète. On peut alors observer les passages des satellites devant Jupiter et les occultations par Jupiter lors de la traversée du cône de visibilité, ou les éclipses ou les passages d'ombre sur la planète lors de la traversée du cône d'ombre. Au cours d'une année, environ 3 000 tels événements (passages début ou fin, éclipses début ou fin, occultations début ou fin, passages d'ombres début ou fin) sont calculables (mais environ 2 200 seulement sont observables). Nous donnons ici une représentation compacte de ces prédictions utilisant un développement polynômial.

### MÉTHODE DE CALCUL :

Les tables des pages 44 et 45 permettent de calculer les dates en TDT des phénomènes des satellites Galiléens de la manière suivante.

Soit  $P$  la période synodique moyenne d'un satellite ; la date approchée  $T_1$  du phénomène proche de la date  $T$  est donnée par la relation :

$$T_1 = K \times P + \tau/24 + T_0 \quad (2)$$

où  $K$  représente la partie entière de la quantité  $(T - T_0)/P$  et où  $\tau$  est donné, sur l'intervalle  $T_0, T_0 + DT$  par un polynôme de la forme :

$$\tau = C_0 + C_1 x + C_2 x^2 + \dots + C_n x^n \quad (3)$$

avec  $x = \{2(T - T_0)/DT\} - 1 \quad (4)$

$T_1$  ayant été obtenu par la relation (2), on peut répéter le calcul en substituant  $T_1$  à  $T$  dans la formule (4) pour obtenir une date  $T_2$  plus proche du phénomène recherché que  $T_1$ . La précision de ce type de prédiction est meilleure que 60 secondes de temps.

Les tables donnent les coefficients  $C_i$  de la formule (3), numérotés de  $C_0$  à  $C_{14}$  pour les quatre satellites et pour les phénomènes :

- débuts et fins des éclipses des satellites par Jupiter (notées respectivement EC.D et EC.F),
- débuts et fins des occultations des satellites par Jupiter (notées OC.D et OC.F),
- débuts et fins des passages de l'ombre des satellites sur le disque de Jupiter (OM.D et OM.F),
- débuts et fins des passages des satellites devant la planète (PA.D et PA.F).

### EXEMPLE D'UTILISATION :

Déterminons les dates des phénomènes du satellite I (Io) au voisinage du 30 juin 1986.

## PHENOMENA OF THE GALILEAN SATELLITES

### DESCRIPTION :

The Galilean satellites which orbits have low inclinations over the equator and the ecliptic, display many phenomena. During each revolution, the first three satellites and, often the fourth one, pass through the visibility and shadow cones which are tangent to the planet. It is then possible to observe the transits of the satellites across Jupiter and their occultations by Jupiter when they pass through the visibility cone, or the eclipses and the shadow transits when the shadow cone is involved. In the course of a year 3 000 such events may be computed (transits ingress and egress, eclipses disappearance and reappearance, occultations disappearance and reappearance, transits of the shadow ingress and egress). Only about 2 200 are observable. A compact representation of these predictions using a polynomial approximation is given here.

### COMPUTATIONAL METHOD :

The tables on p. 44 and 45 permit the computation of the dates in TDT of phenomena of the satellites of Jupiter in the following way.

Let  $P$  be the mean synodic period of a satellite ; the approximate date  $T_1$  of a phenomenon close to a date  $T$  is given by :

$$T_1 = K \times P + \tau/24 + T_0 \quad (2)$$

where  $K$  is the integer part of  $(T - T_0)/P$  and where  $\tau$  is given (on the interval  $T_0, T_0 + DT$ ) by a polynomial :

$$\tau = C_0 + C_1 x + C_2 x^2 + \dots + C_n x^n \quad (3)$$

with  $x = \{2(T - T_0)/DT\} - 1 \quad (4)$

The value  $T_1$  deduced from equation (2) is then substituted in place of  $T$  in equation (4). The new iteration yields a date  $T_2$  closer to the date of the phenomenon than  $T_1$ . The precision of this type of prediction is better than 60 seconds of time. The tables give the coefficients  $C_i$  in formula (3), numbered from  $C_0$  to  $C_{14}$ , for the four satellites and for the following phenomena :

- disappearance and reappearance of the satellites eclipsed by Jupiter (denoted respectively by EC.D and EC.F),
- disappearance and reappearance of the satellites occulted by Jupiter (denoted OC.D and OC.F),
- ingress and egress of the transits of the satellites shadow across the disc of Jupiter (OM.D and OM.F),
- ingress and egress of the satellites transits across the planet (PA.D and PA.F).

### EXAMPLE :

Let us find the dates of the phenomena of satellite I (Io) which takes place near the 30th of June 1986.

Voyons tout d'abord le calcul pour le début d'occultation pour lequel les tables donnent :

$$T0 = 0 ; P = 1,769\ 860\ 5 ; DT = 366$$

Du 0 janvier au 30 juin 1986, 181 jours se sont écoulés, on a donc :

$T = 181$  et la formule (4) donne alors :

$$x = \{2(181 - 0)/366\} - 1 = -0,010\ 928\ 962$$

La formule (3) donne ensuite :

$$\begin{aligned} \tau = & 35.396\ 713 - 1.361\ 964\ x - 6.282\ 018\ x^2 - 1.279\ 462\ x^3 \\ & + 5.203\ 862\ x^4 + 9.081\ 125\ x^5 + 4.847\ 314\ x^6 - 12.892\ 598\ x^7 \\ & - 18.666\ 860\ x^8 + 9.401\ 818\ x^9 + 23.054\ 055\ x^{10} - 3.543\ 933\ x^{11} \\ & - 13.817\ 788\ x^{12} + 0.525\ 266\ x^{13} + 3.336\ 400\ x^{14} \end{aligned}$$

d'où :  $\tau = 35,410\ 849\ 25$

On a d'autre part :

$$K = \text{partie entière de} \\ \{(181 - 0)/1,769\ 860\ 5\} = 102$$

La formule (2) donne alors :

$TI = 102 \times 1,769\ 860\ 5 + 35,410\ 849\ 25/24 + 0$   
 $TI = 182,001\ 223\ 1$  jours depuis le 0 janvier (début de l'intervalle pour les occultations) soit OC.D le 1 juillet 1986 à 0 h 1 min 46 s TDT. Le calcul réitéré donne  $T2 = 182,000\ 936\ 0$  jours soit le 1 juillet 1986 à 0 h 1 min 21 s TDT.

On trouverait de même pour les autres phénomènes :

OC.F : le 1 juillet à 2 h 16 min 46 s TDT  
 EC.D : le 30 juin à 22 h 40 min 37 s TDT  
 EC.F : le 1 juillet à 0 h 57 min 32 s TDT  
 PA.D : le 30 juin à 2 h 41 min 9 s TDT  
 PA.F : le 30 juin à 4 h 54 min 54 s TDT  
 OM.D : le 30 juin à 1 h 22 min 1 s TDT  
 OM.F : le 30 juin à 3 h 37 min 0 s TDT

#### IMPORTANT : Conditions d'existence des phénomènes

Le recouvrement des cônes d'ombre et de visibilité, rend inexistants certains phénomènes. Ainsi, avant (ou après) l'opposition de Jupiter, les fins (respectivement débuts) d'éclipses et les débuts (respectivement fins) d'occultations sont inobservables. Ceci ne pouvant être pris en compte dans la représentation, il est nécessaire que l'utilisateur vérifie les conditions d'existence pour les éclipses et les occultations en calculant les quatre phases EC.D, EC.F, OC.D et OC.F. Ainsi, dans l'exemple précédent, on a dans l'ordre chronologique :

EC.D : le 30 juin à 22 h 40 min 37 s observable  
 OC.D : le 1 juillet à 0 h 1 min 21 s inobservable car déjà éclipsé  
 EC.F : le 1 juillet à 0 h 57 min 32 s inobservable car encore occulté  
 OC.F : le 1 juillet à 2 h 16 min 46 s observable

D'autre part, les caractéristiques de l'orbite du satellite IV (Callisto) font qu'il n'existe pas toujours de phénomènes. Les coefficients relatifs à ce satellite ne sont donc donnés que sur l'intervalle où ils existent.

*Let us start with the computation of the disappearance for the occultation of the satellite for which the tables give :*

$$T0 = 0 ; P = 1.769\ 860\ 5 ; DT = 366$$

*Between January 0 to June the 30<sup>th</sup> 1986, 181 days have elapsed*

*T = 181 and formula (4) gives :*

$$x = \{2(181 - 0)/366\} - 1 = -0.010\ 928\ 962$$

*Formula (3) then gives :*

*therefore  $\tau = 35.410\ 849\ 25$*

*On the other hand,*

$$K = \text{integer part of} \\ \{(181 - 0)/1.769\ 860\ 5\} = 102$$

*Formula (2) then gives :*

*TI = 102 × 1.769 860 5 + 35.410 849 25/24 + 0*  
 $TI = 182.001\ 223\ 1$  days from January 0 (beginning of the interval for the occultations) that is July the 1st 1986 at 0 h 1 min 46 s TDT. Another iteration gives  $T2 = 182.000\ 936\ 0$  days that is July the 1st 1986 at 0 h 1 min 21 s TDT.

*One would find as well for the other phenomena :*

OC.F : July the 1st at 2 h 16 min 46 s TDT  
 EC.D : June the 30th at 22 h 40 min 37 s TDT  
 EC.F : July the 1st at 0 h 57 min 32 s TDT  
 PA.D : June the 30th at 2 h 41 min 9 s TDT  
 PA.F : June the 30th at 4 h 54 min 54 s TDT  
 OM.D : June the 30th at 1 h 22 min 1 s TDT  
 OM.F : June the 30th at 3 h 37 min 0 s TDT

#### IMPORTANT : Conditions for the existence of the phenomena

*As the visibility and shadow cones may sometimes overlap, some of the computed phenomena may not exist. Thus, before (or after) the opposition of Jupiter, the reappearances (respectively the disappearances) for the eclipses, and the disappearances (respectively reappearances) for the occultations are not observable. This could not be taken into account in the representation ; so the user will have to check the existence conditions of the eclipses and occultations by computing the four steps EC.D, EC.F, OC.D and OC.F. For instance, in the example above one has, in chronological order :*

*EC.D : June the 30th at 22 h 40 min 37 s observable*  
*OC.D : July the 1st at 0 h 1 min 21 s unobservable as already eclipsed*  
*EC.F : July the 1st at 0 h 57 min 32 s unobservable as yet occulted*  
*OC.F : July the 1st at 2 h 16 min 46 s observable*

*Moreover, the orbit of satellite IV (Callisto) is such that phenomena are not always present. The coefficients for this satellite are given on the interval for which they exist.*

NAME	mass	radius	sidereal period	geometrical albedo	visual magnitude	orbital period	greatest elongation	semi major axis	eccentricity	inclination on Saturn's equator
unit →	Saturn's mass	km	day			day	(') (")	10 <sup>3</sup> km		degree

#### NOTES

(S) : révolution synchrone

(R) : révolution rétrograde

(1) : inclinaison par rapport à l'écliptique.

Les éphémérides de Phœbé sont données sous la forme de coefficients de Tchébycheff dans le supplément à la Connaissance des Temps « Satellites faibles... »

(2) : « Dioné B » : même orbite que Dioné

(3) : Telesto et Calypso : même orbite que Téthys

(4) : satellites coorbitaux « gardiens » de l'anneau F

(5) : Janus et Epimetheus : même orbite

(S) : *synchronous revolution*(R) : *retrograde revolution*(1) : *inclination on the ecliptic*

*The ephemerides of Phœbe are given as Chebychev coefficients in the supplément à la Connaissance des Temps « Faint Satellites... »*

(2) : « *Dione B* » : *same orbit as Dione*(3) : *Telesto and Calypso : same orbit as Tethys*(4) : *satellites on the same orbit « shepherding » F ring*(5) : *Janus and Epimetheus : same orbit*

Données extraites de l'*Encyclopédie du Bureau des Longitudes*

*Data from the Encyclopédie du Bureau des Longitudes*

## ÉPHÉMÉRIDES DES HUIT PREMIERS SATELLITES DE SATURNE

### EPHEMERIDES OF THE FIRST EIGHT SATELLITES OF SATURN

Coordonnées différentielles tangentielles données en secondes de degré dans le repère équatorial moyen 1950.0 *Differential tangential coordinates given in arcseconds in the mean equatorial frame 1950.0*

$$\begin{aligned}\Delta\alpha \cos\delta &= X \\ \Delta\delta &= Y\end{aligned}$$

$$\left. \begin{matrix} X \\ Y \end{matrix} \right\} = A0 + A1 \cdot t + B0 \sin(Nt + F0) + B1 \cdot t \sin(Nt + F1) + B2 \cdot t^2 \sin(Nt + F2) + C0 \sin(2Nt + P0)$$

où  $t = T - T0$  avec  $T0$  date du début de l'intervalle et  $T$  date du calcul *where  $t = T - T0$  with  $T0$  date of the beginning of the interval and  $T$  the date for the calculation*

## ÉPHÉMÉRIDES DES CINQ SATELLITES D'URANUS

### EPHEMERIDES OF THE FIVE SATELLITES OF URANUS

Coordonnées différentielles tangentielles données en secondes de degré dans le repère équatorial moyen 1950.0. *Differential tangential coordinates given in arcsecond in the mean equatorial frame 1950.0.*

$$\begin{aligned}\Delta\alpha \cos\delta &= X \\ \Delta\delta &= Y\end{aligned}$$

$$\left. \begin{matrix} X \\ Y \end{matrix} \right\} = A0 + A1 \cdot t + B0 \sin(Nt + F0) + B1 \cdot t \sin(Nt + F1) + B2 \cdot t^2 \sin(Nt + F2) + C0 \sin(2Nt + P0)$$

où  $t = T - T0$  avec  $T0$  date du début de l'intervalle et  $T$  date du calcul *Where  $t = T - T0$  with  $T0$  date of the beginning of the interval and  $T$  the date for the calculation*

satellite	intervalle $\Delta t$ (jours)	$N$ (rad/j)	page
Miranda	8	4.488 0	86

N° 60029. Dépôt légal : Avril 1985

Ces éphémérides donnent les positions des satellites Galiléens de Jupiter, des huit premiers satellites de Saturne et des cinq satellites d'Uranus pour 1986 avec une précision de 0.01 seconde de degré ("). Elles sont ainsi très utiles aux astronomes pour préparer ou réduire des observations de haute précision ainsi que pour étudier les mouvements des satellites naturels des planètes.

Les positions sont données sous forme de coefficients de fonctions élémentaires dépendant directement du temps. Les calculs sont faciles à programmer sur une calculatrice de poche ou sur un micro-ordinateur.

Cet ouvrage donne aussi une méthode pour effectuer les prédictions des phénomènes des satellites de Jupiter en 1986.

De telles éphémérides, uniques par leur contenu, méritent de figurer dans les bibliothèques des Universités et des Observatoires.

*These ephemerides give the positions of the Galilean satellites of Jupiter, of the first eight satellites of Saturn and of the five satellites of Uranus for 1986 with an accuracy of 0.01 arcsecond (").*

*Thus, they are very useful to astronomers in order to prepare or reduce precise observations and to study the motions of the natural satellites of the planets.*

*The positions are given as coefficients of elementary functions depending directly on time. The calculations are easy to program on a pocket calculator or on a micro-computer.*

*This booklet also contains a method of calculation to predict the phenomena of the satellites of Jupiter in 1986.*

*Such ephemerides of unique nature, have their place in the libraries of Universities and Observatories.*
