Submitted on 14 Feb 2017

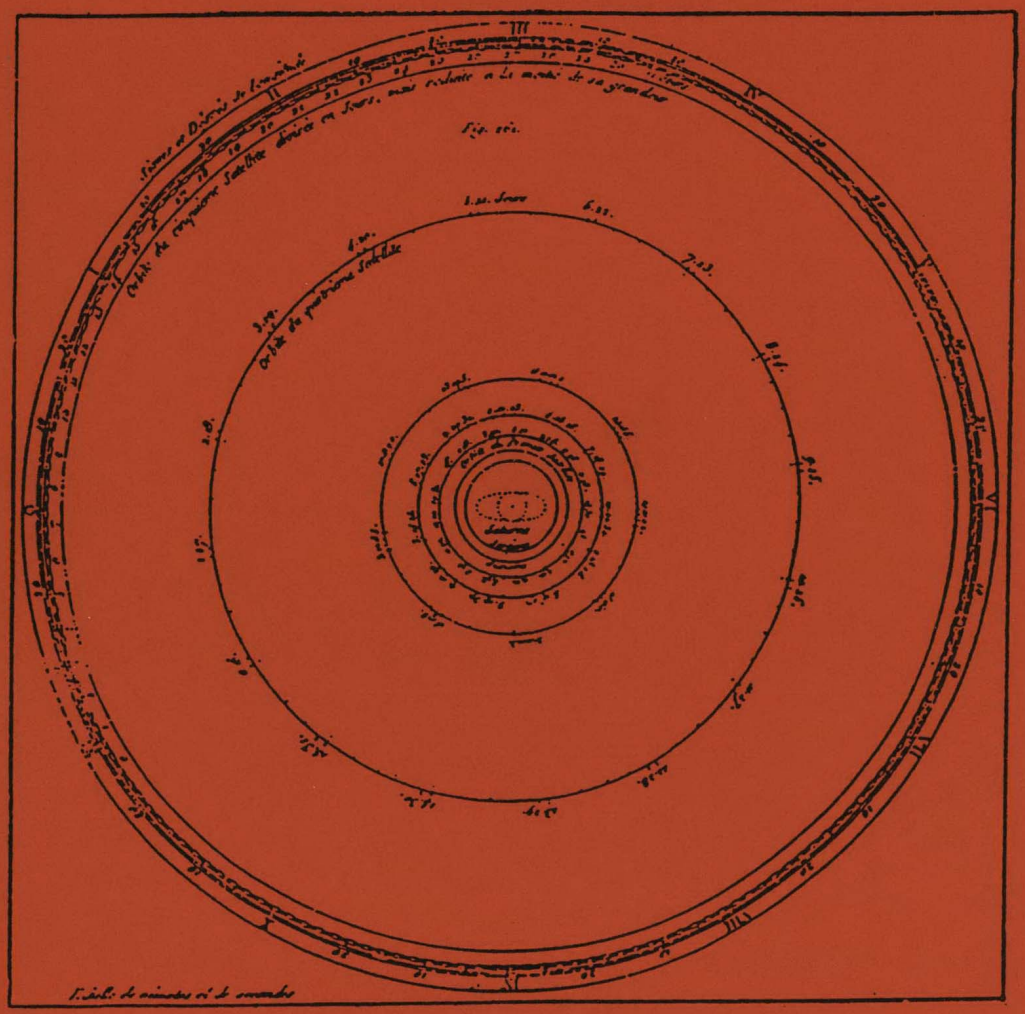
HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

SATELLITES DE SATURNE

I à VIII

CONFIGURATIONS POUR 1995



Supplément à la CONNAISSANCE DES TEMPS

à l'usage des observateurs

Bureau des Longitudes, URA N° 707 du CNRS

Paris, décembre 1994

Couverture : "Instrument pour trouver les configurations des satellites de Saturne", extrait de Lalande 1792, Astronomie tome 3.

Imprimé au Bureau des Longitudes
ISSN 0769 -1025
Dépôt légal : décembre 1994

Avertissement

Le Bureau des Longitudes publie chaque année dans la Connaissance des Temps, les positions des planètes, du Soleil et de la Lune sous forme de coefficients de Tchébycheff. Des suppléments à la Connaissance des temps sont publiés également et donnent :

— les positions des satellites de Mars, des satellites galiléens de Jupiter, des huit premiers satellites de Saturne et des cinq satellites d'Uranus sous forme de fonctions mixtes dépendant directement du temps ;

— les positions des satellites faibles de Jupiter (VI, VII, VIII et IX) et de Phoebé (satellite IX de Saturne) sous forme de coefficients de Tchébycheff;

— les configurations et les phénomènes des satellites galiléens de Jupiter;

Le présent supplément donne les configurations des huit premiers satellites de Saturne dans le but, principalement, d'aider les observateurs à identifier ces satellites. La précision de lecture des courbes permet une précision de positionnement de l'ordre de 10 à 15 secondes de degré (").

Il donne également les dates des phénomènes (éclipses, occultations, passages devant la planète et passages d'ombres) et celles des phénomènes mutuels (éclipses et occultations des satellites les uns par les autres) ces phénomènes se produisent tous les quinze ans.

Foreword

The Bureau des Longitudes publishes each year in the Connaissance des Temps, the positions of the Planets, the Sun and the Moon as Chebychev polynomials. Several supplements to The Connaissance des Temps are also published and give :

— the positions of the satellites of Mars, the Galilean satellites of Jupiter, of the first eight satellites of Saturn and of the five satellites of Uranus as mixed functions depending directly on the time ;

— the positions of the faint satellites of Jupiter (VI, VII, VIII and IX), of Phoebe (satellite IX of Saturn) as Chebychev polynomials ;

— the configurations and the phenomena of the Galilean satellites of Jupiter ;

The present supplement gives the configurations of the first eight satellites of Saturn in order to help the observers to identify those satellites. The precision of the curves allows an accuracy in the position of about 10 to 15 seconds of degree (").

Besides these informations the present bookelet gives the dates of phenomena (eclipses, occultations, transit in front of Saturne, transit of shadows) and the dates of mutual phenomena (the satellites eclipse and occult each other). These phenomena occur every fiveteen years.

J.-E. ARLOT
Directeur du Bureau des Longitudes
URA 707 du CNRS

LE SERVICE MINITEL

DU BUREAU DES LONGITUDES

3616 code BDL

Le Service Minitel du Bureau des Longitudes met à la disposition des professionnels et des amateurs les informations suivantes :

— les heures du lever et du coucher du Soleil et de la Lune, les azimuts et hauteurs du Soleil en n'importe quel lieu, de -4000 à 2500 ;

— les phases de la Lune et les dates des saisons de -4000 à 2500 ;

— les éclipses du Soleil et de la Lune pour cinq années ;

— les positions apparentes géocentriques, les hauteurs et azimuts, les heures du lever et du coucher du Soleil, de la Lune et des planètes de 1900 à 2020 ;

— les coordonnées héliocentriques moyennes de la date des planètes du système solaire de 1900 à 2020 ;

— les positions des satellites naturels et les phénomènes des satellites galiléens pour trois ans ;

— les définitions et les concordances des calendriers, les fêtes légales et religieuses, l'heure légale en France, les dates de changement d'heure et le calcul du jour de la semaine.

Il fournit également des informations ponctuelles comme les passages des comètes et des astéroïdes, les pluies d'étoiles filantes...

NOTES

(S) : révolution synchrone
(R) : révolution rétrograde
(1) : inclinaison par rapport à l'écliptique. Les éphémérides de Phœbé sont données sous la forme de coefficients de Tchébycheff dans le *« Supplément à la Connaissance des Temps : Satellites faibles... »*
(2) : Hélène : même orbite que Dioné
(3) : Telesto et Calypso : même orbite que Téthys
(4) : satellites coorbitaux « gardiens » de l'anneau F
(5) : Janus et Epimetheus : même orbite
(6) : excentricité propre. L'excentricité forcée due à Titan est de 0,0010

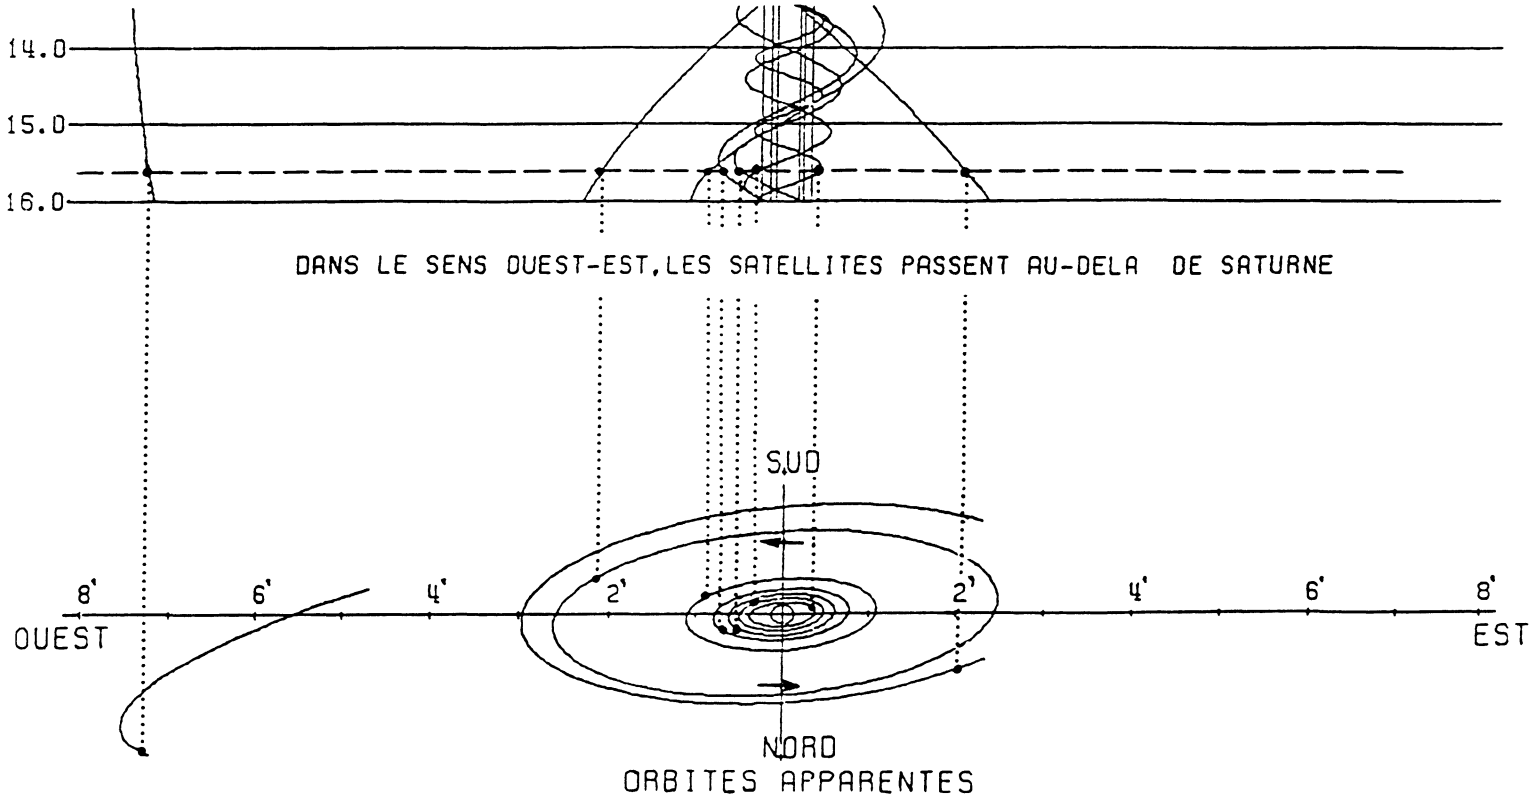
(S) : synchronous revolution
(R) : retrograde revolution
(1) : inclination on the ecliptic. The ephemerides of Phœbe are given as Chebychev coefficients in the « Supplément à la Connaissance des Temps : Faint Satellites... »
(2) : Helene : same orbit as Dione
(3) : Telesto and Calypso : same orbit as Tethys
(4) : satellites on the same orbit « shepherding » F ring
(5) : Janus and Epimetheus : same orbit
(6) : proper eccentricity. The forced eccentricity due to Titan is 0.0010

USAGE DES CONFIGURATIONS

Les configurations permettent d'identifier les satellites et de déterminer leur position en coordonnées tangentielles équatoriales relatives à Saturne avec la précision suivante (pour une lecture des courbes à 0,5 millimètre près) :

I	:	2 à 10"	V	:	2 à 3"
II	:	2 à 8"	VI	:	2 à 3"
III	:	2 à 6"	VII	:	2 à 3"
IV	:	2 à 4"	VIII	:	2 à 3"

L'exemple suivant montre comment procéder :



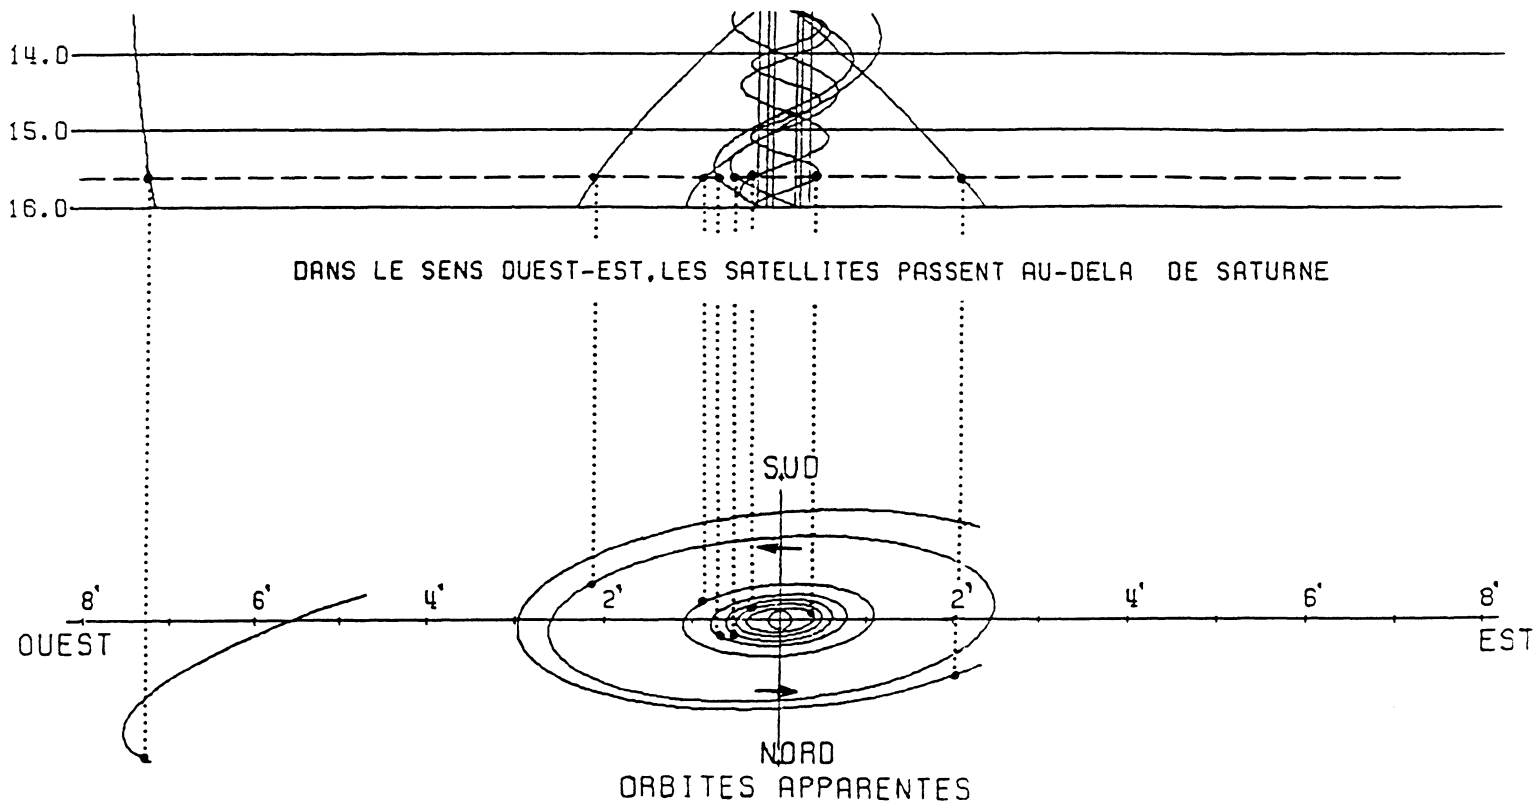
On reporte en abscisse sur l'axe ouest-est les distances $\Delta\alpha \cos\delta$ mesurées, pour la date voulue, sur les courbes. L'ordonnée est donnée par les orbites apparentes. L'indétermination avant/arrière est levée grâce au sens de rotation des satellites.

THE USE OF CONFIGURATIONS

The configurations allow the identification of the satellites and the determination of their position in tangential equatorial coordinates referred to the planet Saturn with the precision as follow (for a lecture on the curves with an accuracy of 0.5 millimeter) :

I	:	2 to 10"	V	:	2 to 3"
II	:	2 to 8"	VI	:	2 to 3"
III	:	2 to 6"	VII	:	2 to 3"
IV	:	2 to 4"	VIII	:	2 to 3"

This example shows how to proceed :



The distances $\Delta\alpha \cos\delta$, measured on the curves for the choosen date, are plotted in abscissa on west-east axis. The ordinate is given by the apparent orbits. The direction of the rotation indicates if the satellite is before or behind the planet on its orbit.

PHÉNOMÈNES DES SATELLITES DE SATURNE POUR 1995

PHENOMENA OF THE SATURNIAN SATELLITES FOR 1995

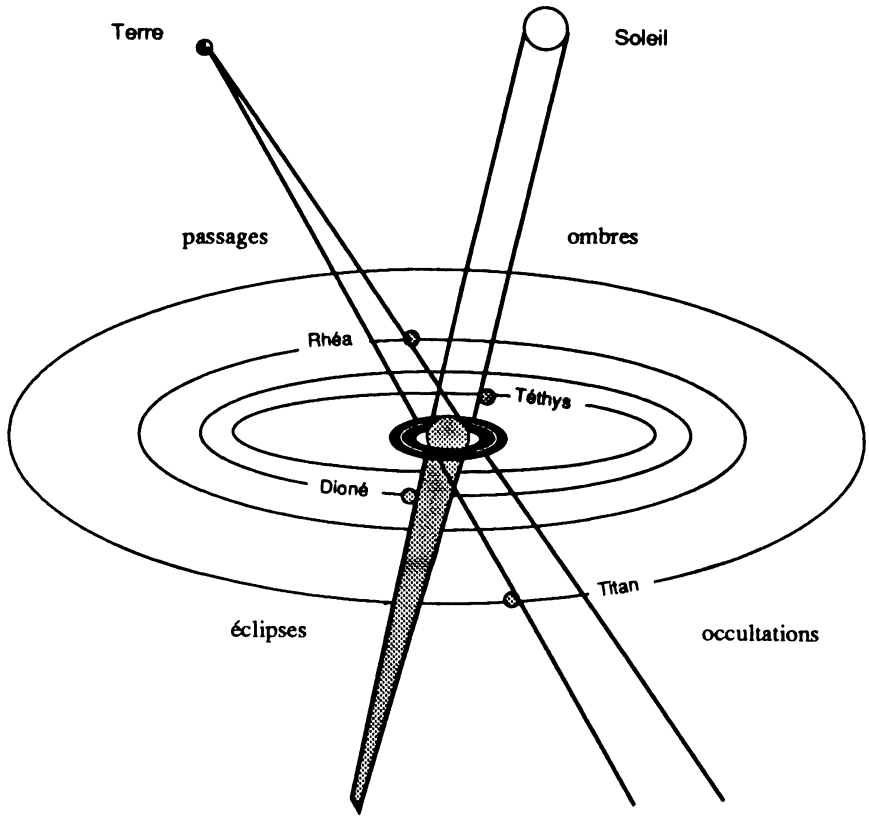

Fig. 1. Phénomènes des satellites de Saturne. Eclipse de Dioné, occultation de Titan, passage de Rhéa devant la planète et passage de l'ombre de Téhys sur Saturne.

EXPLICATIONS CONCERNANT LES PREDICTIONS DES PHENOMENES DE SATURNE

Tous les quinze ans la Terre et le Soleil traversent le plan orbital des satellites de Saturne. Il est alors possible d'observer des phénomènes semblables aux phénomènes bien connus des satellites galiléens de Jupiter: éclipses et occultations des satellites par Saturne, passages de satellites devant le disque de Saturne ou passages de leur ombre projetée sur ce disque. Dans les pages suivantes on trouvera les prédictions de ces phénomènes. Pour les distances apparentes du satellite au Soleil inférieures à 30° et des distances apparentes à la Lune inférieures à 5°, le type de phénomène est marqué d'un astérisque signifiant la plus grande difficulté d'observation. C'est aussi le cas de certaines éclipses pour lesquelles le satellite se trouve à moins de 4" du bord de Saturne. Ces prédictions de phénomènes ont été réalisées à partir de la théorie des mouvements des satellites de Saturne de Dourneau (1993). On trouvera des détails sur ces prédictions dans (Arlot et Thuillot, 1993).

Nous donnons les dates des débuts et fins de passages devant Saturne (Pd et Pf), des débuts et fins de passages des ombres sur le disque de Saturne (Od et Of), des débuts et fins d'éclipses par Saturne (Ed et Ef) ainsi que celles des débuts et fins d'occultations par la planète (Im pour immersions et Em pour émersions). Ces calculs ne tiennent pas compte du diamètre des satellites et ne concernent que leur centre: ces dates correspondent donc au milieu du phénomène. Elles sont données dans l'échelle du Temps Terrestre.

Pour une trajectoire apparente équatoriale, l'intervalle de temps séparant le début et la fin des phénomènes (premiers et derniers contacts) va de 14s pour Mimas (S1) à 450s pour Titan (S6).

COMMENTS ON THE PREDICTIONS OF THE PHENOMENA BY SATURN

Every fiveteen years the Earth and the Sun pass through the orbital planes of the Saturnian satellites. It is then possible to observe phenomena similar to the well known phenomena of the Galilean satellites of Jupiter: eclipses and occultations of the satellites by Saturn, transits in front of the planetary disk, transits of the shadows of the satellites projected on the disk of the planet. In the following pages we give a list of these phenomena. Some phenomenon may be difficult to observe, they are labeled with an asterisk. This is the case for the phenomena surrounding when the sun is at less than 30°, or the moon at less than 5°. This is also the case for eclipses of satellites located at less than 4" from the edge of Saturne. The predictions have been made using Dourneau's theory of the motion of the Saturnian satellites (Dourneau, 1993). Further details on these predictions can be found in (Arlot and Thuillot, 1993).

We give the dates of the beginning and the end of the transits in front of Saturn (Pd and Pf), of the transits of the shadow (Od and Of), of the eclipses by Saturn (Ed and Ef), of the occultations by the planet (Im for immersions and Em for emersions). These computations are made with no consideration of the diameter of the satellites but concern their center: these dates are the dates of the mid events. They are given in the Terrestrial Time scale.

For an equatorial apparent orbit, the time interval between the beginning and the end of these phenomena (first and last contacts) is from 14s for Mimas (S1) up to 450s for Titan (S6).

PHÈNOMÈNES MUTUELS

LES PHENOMENES MUTUELS

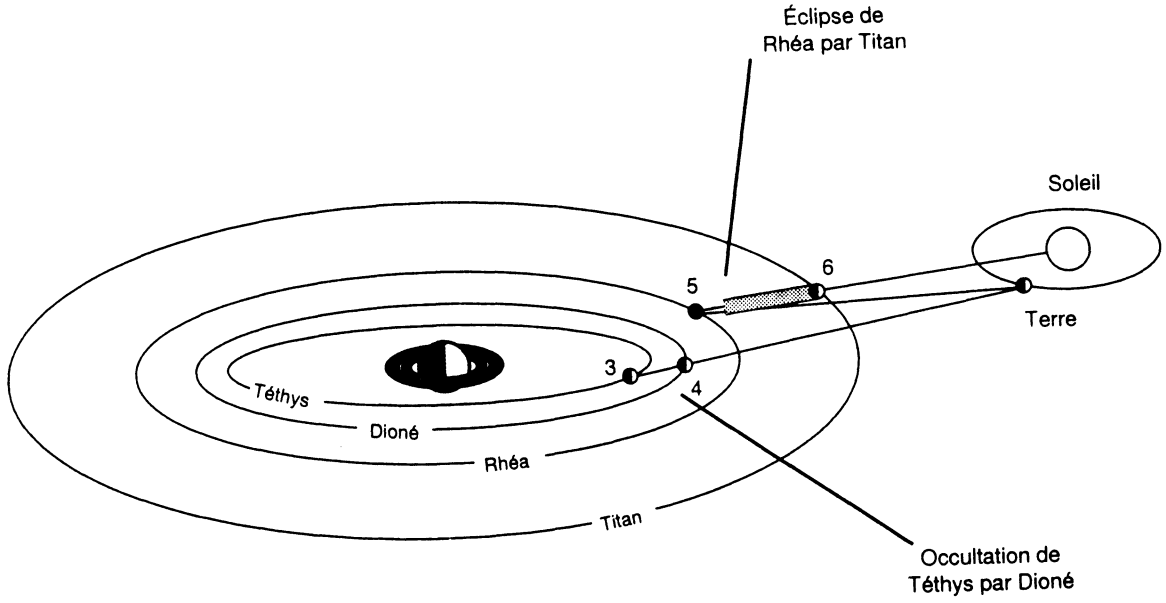
Une période favorable de quelques mois en 1995 va rendre possible l'observation de phénomènes mutuels des satellites de Saturne.

La configuration des orbites des satellites de Saturne permet l'apparition de phénomènes mutuels deux fois durant chaque révolution de Saturne, soit tous les quinze ans. Les orbites des satellites (exceptée celle de Japet) se trouvent quasiment dans le plan équatorial de Saturne. Quand la Terre traverse ce plan, c'est-à-dire quand la déclinaison satunicentrique de la Terre s'annule, un observateur terrestre peut voir les satellites s'occulter l'un l'autre (voir fig. 2).

MUTUAL PHENOMENA

In 1995 a favorable period of several months allows the observation of mutual phenomena involving the Saturnian satellites.

The configuration of the orbits of the Saturnian satellites induces phenomena between the satellites themselves twice each Saturnian year of 15 years. Except Iapetus, the Saturnian satellites have orbits which are nearly in the equatorial plane of Saturn. When the Earth goes through this plane, i.e. when the Saturnicentric declination of the Earth becomes zero, the satellites may occult one another for a terrestrial observer (see fig. 2).



dessin S. Pottier

Fig. 2. Phénomènes mutuels des satellites de Saturne; éclipse de Réa par Titan et occultation de Téthys par Dioné.

De la même façon, quand le Soleil traverse le plan équatorial de Saturne, c'est-à-dire quand la déclinaison saturnicentrique du Soleil s'annule, un satellite peut se trouver dans l'ombre ou la pénombre d'un autre satellite.

Du fait de leurs petites tailles et de la faible inclinaison de leur orbite sur l'équateur de Saturne, les satellites ne présentent pas de phénomènes mutuels pour chaque conjonction géocentrique (pour les occultations) ou héliocentrique (pour les éclipses) pendant la période favorable. Cette période a lieu quand les déclinaisons saturnicentriques de la Terre et du Soleil sont plus petites qu'une quantité donnée. Ces phénomènes sont facilement calculables avec les ordinateurs actuels et leur observation qui ne présente pas de difficultés majeures donne des informations très intéressantes sur les satellites eux-mêmes.

LES PREDICTIONS POUR 1995

Pour les calculs des dates des phénomènes, nous avons utilisé les éphémérides des satellites de Saturne (Dourneau, 1993). Nous avons utilisé également les éphémérides des planètes VSOP82 (Bretagnon, 1982).

EXPLICATION DES TABLES

Les tables donnent les dates prévues pour les phénomènes mutuels. Ces dates sont donnés dans l'échelle de temps terrestre TT. Cette échelle de temps est très proche du Temps des Ephémérides ou du Temps Atomique International plus 32 secondes (TAI + 32 s). On obtient les dates des phénomènes en Temps Universel (UT) en soustrayant 61 secondes aux dates données dans les tables.

On trouve dans ces tables:

— le mois, le jour, l'heure et la minute (au dixième près) du maximum du phénomène ;

— la définition du phénomène sous la forme A E B pour l'éclipse du satellite B par le satellite A, A O B pour l'occultation du satellite B par le satellite A;

— le type de phénomène:
P signifie partiel
A signifie annulaire
T signifie Total
C signifie conjonction et désigne un rapprochement de satellites pouvant éventuellement donner lieu à une occultation ou une éclipse.

Similarly, when the Sun goes through the equatorial plane of Saturn, i.e., when the Saturnicentric declination of the Sun becomes zero, the satellites may enter in the umbra or the penumbra of the other satellites.

Because of the small size of the satellites and the very small inclination of their orbit to the Saturnian equator, mutual phenomena do not occur for each geocentric conjunction (for the occultations) or heliocentric one (for the eclipses) during the favorable period. This favorable period occurs when the Saturnicentric declinations of the Earth and the Sun are smaller than a defined quantity. These phenomena are easily predictable with modern computers and their observation - which presents no major difficulties - gives interesting information about the satellites themselves..

BASIS OF THE PREDICTIONS FOR 1995

For the calculations of the dates of the phenomena, we used the Dourneau's ephemerides (Dourneau, 1993) of the Saturnian satellites. We used also the ephemerides of the planets VSOP82 (Bretagnon, 1982).

EXPLANATION OF THE TABLES

The tables gives the dates of the predicted phenomena. These dates are given in the TT scale (Terrestrial Time). This time scale is very close to the Ephemeris Time (ET) or to the International Atomic Time plus 32s (TAI + 32s). One obtains the times of the mutual phenomena in the Universal Time scale (UT) by subtracting 61 seconds of time from the times given in the tables.

Are given in the tables:

— the month, day, hour and minute (to the nearest tenth of minute) of the maximum of the phenomenon;

— the definition of the phenomenon:
A E B means eclipse of satellite B by satellite A,
A 0 B means occultation of satellite B by satellite A;

— the type of phenomenon:
P means partial
A means annular
T means total
C means conjunction and corresponds to the close approach of two satellites which could eventually lead to the observation of an eclipse or an occultation ;

Lorsque le type de phénomène n'est pas indiqué, il s'agit d'une éclipse par la pénombre;

— la grandeur qui est donnée dans une échelle de 0 à 1 et caractérise la chute en flux lumineux. A désignant une disparition totale;

— la durée qui est donnée en secondes de temps.

no type is given for the eclises by the penumbra;

— the light flux drop given in a scale from 0 for no light flux drop to 1 for total disappearance of the satellite;

— the duration in secondes of time.
